Overview and setting of the course

Climate change is one of the big political challenges of our time. It has been on the political agenda for some 30 years, in an increasing number of countries. With the Paris Agreement, almost all countries in the world have committed themselves to contributing their share to limiting the global temperature to well below 2 degrees, implying a commitment to a fully carbon-neutral global economy by mid-century. This is a huge challenge – economically and technologically, for sure, but especially also societally and politically.

In terms of emission reductions, one cannot say that it has gone well: globally, GHG emissions are still increasing. To the largest extent, this is caused by economic growth and industrial development in emerging countries, causing a hunger for energy that is often fed with fossil energy, including oil for the growing transport systems and coal or gas power for the power grids.

In the industrialised world, however, emissions generally decrease. In Europe, for example, GHG emissions have decreased by some 20% compared to 1990, and the European Union may meet its 2020 climate target. Evidently, it is possible bend the emissions curve. In particular in the energy sector – responsible for some 2/3 of global greenhouse gas emissions – starts seeing radical changes, both through the rise of renewable energy technologies and efficiency measures. In Europe, at least some policy efforts appear to have worked: emissions and energy demand are decreasing, and European (together with a handful of other countries’) policies have contributed to making renewables technologically and economically viable, putting Europe and all other countries in a position where complete energy system decarbonisation may be feasible.

In this course, we will explore the instrumentation of climate policy in the energy sector, especially on the European and national levels. The course will centre on historical and prospective policy analysis of energy policy instruments, drawing on concepts, theories and evaluation frameworks from various disciplines, including political science and environmental, behavioural and evolutionary economics. We will go far beyond the conventional description of “climate policy” as global treaties and carbon pricing, and look at the broad set of policy instruments that affect the chances to decarbonise energy, with a focus on the European context. In this course, we will

- investigate different types of energy policy instruments, their theoretical roots and expected effects;
- analyse the actual performance of these instruments through case studies of both successful and failed historical cases, in order to understand how instrument design affects success chances, but also how instruments differ in both scope and aim;
- learn how instruments interact in a policy mix, each performing a specific task and contributing to a successful energy transition;
- create policy solutions to take us from today’s fossil-based system to a carbon-neutral energy future in Europe.

Learning objectives

Students understand the breadth of the climate and energy policy field, the diversity of instruments, and know how the main instrument types work and interact. They are able to identify a policy and allocate it to the appropriate discourse and theoretical roots. Students are able to evaluate whether a policy is likely to achieve its aims, informed by knowledge of the functioning, efficiency and effectiveness of similar policies elsewhere or in the past, and can suggest alternative or complementing policies for achieving a particular energy policy goal. Students are able to generalise and combine knowledge about the barriers to decarbonisation in various energy sectors and the barriers addressed by specific policy instruments as applied in cases discussed in class, in order to create own suggestions for decarbonisation of any energy sector or geographic context.

Course outline

The course is designed in a flipped classroom approach, with extensive preparations needed – both reading and watching the input presentations for each class (see below) – and strongly interaction-based meetings in class. In the class meetings, we will be working together and in groups to solve case problems taken from real-world situations in European energy policy, from heat decarbonisation in Finland to wind power deployment in France or bikelanes in Amsterdam.

The main input format for each seminar day will be presentations by students, for each block 4-5 presentations (depending on the number of students) of 15-20 minutes each, focusing either on the theoretical embedding of the class or on describing and evaluating real-world cases in which the instrument has been implemented. The presentations will be graded, forming the base for a pass/fail or, if you also write a semester thesis, making up a part of your final grade. All will receive written feedback from me, as I believe this is essential for learning and improving presentation skills.

These presentations will be recorded by the students and the videos made available on the University’s media portal (MediaUP) via Moodle, at least 3 days before each class day. Instead of sitting through 1.5 hours of presentations on each seminar day, which would be tiring for all, we “shift” this time to before the actual meeting, so that the 180 minutes of seminar each physical meeting will instead be around 120 minutes, so from 9-1130 (including coffee and buffer time). It does not reduce the workload or teaching time, but it does increase the flexibility in preparing for class. It will also allow us to switch to online mode, should it become necessary once again, while still maintaining the same presentation setting the same, keeping things fair for all students. [note: the course will take place on site in the university, unless the next disaster strikes]

Every student will need to view these in preparation of each seminar. In addition to the set of mandatory readings. The students presenting will also need to read the mandatory readings, but their presentations must go well beyond that, focusing on theory (1 of the 4/5 presentations) or case studies (the rest).

Each meeting will start with a Q&A session and a brief feedback to the students who presented. The feedback will be

Literatur

Wir werden wissenschaftliche Literatur, sowie Primärquellen lesen, als Vorbereitung für jede Sitzung. Wir werden ausserdem ein Buch (Grubb: *Planetary Economics*) lesen.

Kommentar

Course description

The Advanced Earth Observation module is aimed at students from relevant MSc programs (CLEWS, Geo-Ecology, RSIV,) that are interested in deepening their knowledge and experience in the field. The course is designed to build upon the basic remote sensing modules (such as "Angewandte Fernerkundung in der Geoökologie" or "Remote Sensing of the Environment") and requires students to enter with a basic knowledge of remote sensing principles, methods and applications. We will use R for lab exercises and expect knowledge in a programming language (i.e. R).

It provides students the opportunity to acquire further knowledge in the field of earth observation on advanced topics with focus on optical remote sensing; such as more physics on remote sensing, radiative transfer models for biophysical parameter retrieval, LiDAR for deriving vegetation structure, time-series analysis and deep learning methods in land remote sensing, and innovative approaches for in-situ calibration and validation. Acquiring advanced knowledge will be provided through lectures of leading remote sensing experts and gaining hands on experiences through practicals. The teaching and topics of the course are aligned with some of the ongoing research at the German Research Centre for Geosciences (GFZ) in Potsdam and will also link with the recent EO-College online courses MOOC4LAND and HYPERedu. Next to lectures and practicals, part of the course focuses on performing a synthesis on recent Earth Observation papers that will be presented and discussed with the group.

The module is an advanced course that will be offered in the summer term. It consists of weekly lectures (2 hr) and practical sessions (2 hr).

The module aims for the following learning outcomes:

Thematic outcomes

- deepen understanding of novel Earth Observation concepts, methods and applications;
- demonstrate knowledge on advanced earth observation topics taught in the course;
- show awareness of innovative earth observation developments;

Methodological outcomes

- critically evaluate earth observation concepts and methods presented during the course;
- apply the acquired knowledge through practical exercises;
- synthesize the outcome of an innovative Earth Observation study through presenting a recent scientific paper

Practical outcomes

- analyze the use of innovative earth observation techniques for various applications;
- conceptualize and design state-of-the-art earth observation solutions for specific applications and remote sensing services;

Requirements:

- Should have completed a basic remote sensing course (such as modules "Angewandte Fernerkundung in der Geo-Ökologie" or "Remote Sensing of Environment" or at Uni Potsdam)
- Should have good command and knowledge in R-programming and image processing techniques

Examination:

- Requirement to participate in the final exam: Results of exercises as requirement to be admitted to final examination (80% of homework completed) NOTE: This will not be part of the grade, but is a requirement to participate in the final exam.
- Final exam (100%)

Bemerkung

Note: The lecture and exercise will take place on the Golm campus in house 27, room 0.29/.30.

Lerninhalte

Draft syllabus

Lecture-Week	Lecture (~ 90 min)	Practical (1.5-2 hrs + self study)
	Easter Monday	
1 (25. Apr)	Environmental optics/spectra (Herold)	Calculations (Herold), Intro R
2 (2. May)	Multispectral satellite remote sensing and atmospheric correction (Segl)	SNAP/Sen2Cor (Segl)
3 (9. May)	Hyperspectral image processing (Bohn et al.)	ENMAP toolbox (Bohn)
4 (16. May)	Biophysical parameters, spectral effects and RTM (Brede)	RTM sensitivity (Brede)
5 (23. May)	Inversions and parameter retrieval (Brede)	RTM inversions (Brede)
6 (30. May)	UAV/terrestrial-based remote sensing (Brede)	Field/drone practical (Brede)
	Pentecost	
7 (13. June)	Advanced LIDAR (Brede)	Exploring drone-acquired data (Brede), reading papers
8 (20. June)	Time series analysis of land surface dynamics (Herold)	BFAST practical (Herold)
9 (27. June)	Information extraction and machine learning in land remote sensing (Herold)	Paper presentation/discussion
10 (4. Juli)	Accuracy and uncertainty analysis for land remote sensing products (Herold)	Biomass uncertainty estimation (Herold)
11 (11. Juli)	Large area forest/land monitoring and carbon accounting (Herold)	IPCC accounting MOOC – module (Herold)
12 (18. Juli)	Final exam	---

Leistungen in Bezug auf das Modul							
PNL	527402 - Übung (unbenotet)						

Glossar

Die folgenden Begriffserklärungen zu Prüfungsleistung, Prüfungsnebenleistung und Studienleistung gelten im Bezug auf Lehrveranstaltungen für alle Ordnungen, die seit dem WiSe 2013/14 in Kraft getreten sind.

- Prüfungsleistung** Prüfungsleistungen sind benotete Leistungen innerhalb eines Moduls. Aus der Benotung der Prüfungsleistung(en) bildet sich die Modulnote, die in die Gesamtnote des Studiengangs eingeht. Handelt es sich um eine unbenotete Prüfungsleistung, so muss dieses ausdrücklich („unbenotet“) in der Modulbeschreibung der fachspezifischen Ordnung geregelt sein. Weitere Informationen, auch zu den Anmeldeöglichkeiten von Prüfungsleistungen, finden Sie unter anderem in der [Kommentierung der BaMa-O](#)
- Prüfungsnebenleistung** Prüfungsnebenleistungen sind für den Abschluss eines Moduls relevante Leistungen, die – soweit sie vorgesehen sind – in der Modulbeschreibung der fachspezifischen Ordnung beschrieben sind. Prüfungsnebenleistungen sind immer unbenotet und werden lediglich mit "bestanden" bzw. "nicht bestanden" bewertet. Die Modulbeschreibung regelt, ob die Prüfungsnebenleistung eine Teilnahmevoraussetzung für eine Modulprüfung oder eine Abschlussvoraussetzung für ein ganzes Modul ist. Als Teilnahmevoraussetzung für eine Modulprüfung muss die Prüfungsnebenleistung erfolgreich vor der Anmeldung bzw. Teilnahme an der Modulprüfung erbracht worden sein. Auch für Erbringung einer Prüfungsnebenleistung wird eine Anmeldung vorausgesetzt. Diese fällt immer mit der Belegung der Lehrveranstaltung zusammen, da Prüfungsnebenleistung im Rahmen einer Lehrveranstaltungen absolviert werden. Sieht also Ihre fachspezifische Ordnung Prüfungsnebenleistungen bei Lehrveranstaltungen vor, sind diese Lehrveranstaltungen zwingend zu belegen, um die Prüfungsnebenleistung absolvieren zu können.
- Studienleistung** Als Studienleistung werden Leistungen bezeichnet, die weder Prüfungsleistungen noch Prüfungsnebenleistungen sind.
